1.		S	GEN	MM 7-1-1 rev Nov 27/80										
Check: A, B, C, C1, C2														
Zones:														
Access:														
<u>AIRCRAFT JACKING.</u>														
A. Raise Airplane. (Fig. 201).														
<u>CAUTION:</u> Do not exceed one inch clearance from jack ram locknut to collar as jack is being raised or lowered. Excessive clearance can result in damage to airplane structure if jack fails.														
1. Ensure that maximum allowable loads of individual jacking points are not exceeded. Ensure that all LDG downlocks are in place.														
<u>WARNING:</u> To avoid possible injury to personnel & damage to airplane, all jacks & jack points must be manned & monitored continuously until a final static position is reached.														
2. Install jack pad adapters & position jacks per fig 201, making sure that one leg of each at position C point FWD.														
<u>NOTE:</u> Jacks must be equipped with pressure gage & a conversion table to give pounds of load at each jack point. Jack adapters are attached to the airplane structure by screws or bolts as listed:														
<table style="width: 100%; border: none;"> <tr> <td style="width: 50%;">Jack Point B – F71139</td> <td style="width: 50%;">Eight AN6-15A or equivalent.</td> </tr> <tr> <td>Jack Point C – F80060-2</td> <td>One NAS514P1032-24 or equivalent.</td> </tr> <tr> <td>Jack Point F – F70009</td> <td>One NAS603-26 or equivalent.</td> </tr> <tr> <td>Jack Point G – F71138-500</td> <td>Two AN5-10A or equivalent.</td> </tr> </table>							Jack Point B – F71139	Eight AN6-15A or equivalent.	Jack Point C – F80060-2	One NAS514P1032-24 or equivalent.	Jack Point F – F70009	One NAS603-26 or equivalent.	Jack Point G – F71138-500	Two AN5-10A or equivalent.
Jack Point B – F71139	Eight AN6-15A or equivalent.													
Jack Point C – F80060-2	One NAS514P1032-24 or equivalent.													
Jack Point F – F70009	One NAS603-26 or equivalent.													
Jack Point G – F71138-500	Two AN5-10A or equivalent.													
3. Remove wheel chocks & release parking brakes.														
4. Use plumb bob & leveling scale in LH wheel well to establish level lateral & longitudinal attitude while raising airplane.														
<u>NOTE:</u> This method of leveling is accurate enough for general jacking requirements & gear retraction only.														
5. Raise airplane in level attitude, using jacks at wing jack pad C & tail jack pad G, until landing gear clears ground. Raise airplane until wheels clear ground 4 to 5 inches for landing gear retraction test.														
<u>CAUTION:</u> Jacks at pads C must be raised prior to or simultaneous with jack pad G. Raising tail jack ahead of wing jacks may overload tail jack point, by forcing nose of airplane down on nose gear, or it may overload tail jack point & nose stabilizing jack point when latter is used.														
<i>Jack the airplane in a level attitude to prevent introducing side loads into the jack point that could cause the jacks to slip off the pads or overload the jack points & damage structure.</i>														
6. If conditions require that airplane be stabilized, raise outboard wing jack F & nose jack B until sufficient weight is supported to steady airplane. This load should be up to a maximum of 5000 pounds at 35 mph wind at each jacking point.

REF H 40 REQ rev . AIRCRAFT JACKING & LOWERING

	MAINT	RII/INSP
<p>B. Lower Airplane.</p> <p>CAUTION: <i>Do not exceed one inch clearence from jack ram locknut to collar as jack is being raised or lowered. Excessive clearence can result in damage to airplane structure if jack fails.</i></p> <ol style="list-style-type: none"> 1. Check that the area immediately under the airplane is clear & that all landing gear downlocks are installed. 2. Loosen set screws in ram locknut at jack & adjust locknut up ram until it is no more than one inch from jack collar. <p>NOTE: <i>It may be necessary to raise jack ram slightly to relieve load on locknut & allow locknut to be moved up ram.</i></p> <ol style="list-style-type: none"> 3. Lower stabilizing jacks at jack point B & F maintaining one inch or less clearence between locknut & collar. 4. Lower main jacks at jack point C & G evenly & all together, maintaining one inch or less clearence between locknut & collar. <p>CAUTION: <i>Do not allow jack C under wing to precede tail jack G, otherwise nose gear will touch first & over load tail jacking point G. A jack hang-up condition may be relieved bu raising & lowering jack until ram is freed. If hang-up continues it will be necessary to raise & crib airplane while faulty jack is replaced.</i></p> <ol style="list-style-type: none"> 5. Remove jacks & jack pad adapter.
